There are many options to choose from, but to save you some time, we chose the best apps for Android and iOS. Camera Whether you have an iPhone or an Android phone, the simplest and easiest app to use to scan QR codes is often your Camera app. This will now be on your phone, so all you need to do is open the app and point it to a QR code. On newer iPhones, you can even use the flashlight to scan QR codes in low light. It's as simple as that. After pointing your phone's camera to the QR code, you should see a notification if you want to go to the website where the juicy QR code is. Tap it to open the link and go where the QR code wants to send you. If the feature doesn't work on your phone, you can read to find some good QR code scanning apps. As simple as the Camera app, it also doesn't come with the bells and whistles of certain third-party apps for scanning QR codes. Android iOS editors' recommendations If you're looking for a good way to speed up your phone or reduce your data usage, there are many official lite versions of popular apps like Facebook or YouTube. They are generally less rich in functions than their proxy counterparts, but they are often a large middle ground between functions and functions. What are Lite applications? RELATED: How to monitor (and reduce) data usage for Android, big companies like Google, Facebook and Twitter want as many people as possible to use their services. But not all phones are powerful for their full-featured apps, and some data plans are severely limited. So, they have created lite versions of their apps for these audiences. This is not to be confused with the hundreds of improvised Lite apps out there that are just containerized versions of mobile websites, the applications in this list are official applications provided by the original developers (but they are still containerized versions of mobile web applications). This is an important and remarkable mention because there are many fakes out there - we recommend using the official lite apps whenever you can. These official lite versions are usually designed for use in countries with less powerful Android devices and slower mobile Internet. They keep speed and data usage down, skipping unnecessary features that people with slower connections won't be able to use anyway. But this can also apply to ordinary users: if you're a casual user of something like Facebook, chances are there are tons of features that just take up space. Why don't you speed things up when you get rid of them? RELATED: How to sideload Apps on Android Since these apps are usually designed for other countries, they are usually not available from the Google Play Store in countries that have very reliable data networks and ultra-powerful phones, such as the United States. But you can still side by taking the installer of APK files from a site like APK Mirror – a legitimate and reliable source for these apps. (If you've never loaded an app, see our guide to doing it - it's pretty easy!) This way, if you have a slower or older Android device, you can still take advantage of lighter and streamlined apps and make your phone feel more nervous and new again. As great as the apps are on their own, they're also just help to tape the bigger problem: the operating system as a whole. Android has acquired more and more features rich over the years, and as a result has required more powerful hardware to push it. But that's also why Google created a version of Android specifically for bottom end hardware and the countries where these types of phones are prolific: Android Go. Android Go is to what these applications are for the app ecosystem: a faster, lighter version of the operating system. It is designed to work on devices less than 1GB ram, making it incredibly efficient. Of course, compromises are easy when you need to modify a system to work on such limited hardware, but just as with Lite apps, it is that is expected. And frankly, it's much better than working with slow hardware that tries to compensate for the lack of optimization. The best Lite Apps Ok, now that you know what lite apps are and why you want to use them, it's time to look at the best options for the apps you're probably already using. Facebook Lite Facebook is one of the most popular apps in the Play Store, but the full app is known to be very large. The main application is almost 65MB in size, where the much smaller version of Lite only makes the scale of 1.6MB. That's a huge difference. And compared to Facebook's full app, the lite version really isn't that bad. It feels a bit dated without all the bells and whistles, but if all you're really worried about is checking notifications and scrolling through your feed (literally all my use of Facebook), then it's great. You won't be able to do things like go live, but most things are available. Download Facebook Lite: Game Store (Outside the US) | APK Mirror Facebook Messenger Lite Like Facebook Lite, there is a light version of Messenger too. It lacks almost all the more reliable Messenger features, such as video chat, Facebook calls, SMS integration and chat heads, but it's pretty solid if all you want to do is text chat with Facebook friends. As a result, Messenger Lite is about a fifth the size of the full Messenger app (11MB vs. 55MB). Unlike most other apps on this list, Messenger Lite is available in the US from the Play Store. Woohoo! Messenger Lite: Game Store (included in usa) | APK Mirror Twitter Lite Keith Lite is probably the best Lite app on this list as it is almost as strong as a much larger counterpart. It's essentially a packaged version of Twitter's mobile website that has undergone some major improvements over the past few months - as a result you'll get a killer lightweight Twitter customer who offers almost everything you need (including push notifications!). If you prefer not to download and install anything else, you can always just skip to twitter's mobile site to get basically the same experience. Personally, I'm in that I have a separate app, but you do. Twitter Lite: Game Store (Non-USA) | APK Mirror Google Go It's basically just a lightweight Google search app - but unlike other Lite apps that only skip excessive and heavy features, this one removes some useful things, including my favorite thing about the Google app: Google Feed. As a result, it's literally a search app with a few quick links things like the weather and all that. This is probably understood, but it means that there is no integration assistant in Google Go. However, it's not terrible and it's nice to have a super light and fast version just for quick search, search, that's your thing. Google Go: Play Store (Outside the US) | APK mirror YouTube Go look, everyone loves YouTube. But if you find a YouTube stock app a little bulky and slower, the answer is YouTube Go. It's super fast and light and offers some of the better features of the inventory app, such as the option to save videos to watch offline. It even asks what you want to do (save or see) every time you select a video and offers different levels of quality. That's really cool. YouTube Go: Game Store (Outside usa) | APK Mirror Skype Lite Related: The best ways to video chat from Windows, Mac, iPhone or Android There are many good video chat apps out there, many of which are probably better than Skype —but if your grandmother uses Skype, you're blocked using Skype too. Fortunately, there is a lite version. This app actually uses the Google Play testing feature because it's technically an unsigned app — at least at an official level. Like his older brother, he offers voice and video calls, text chats and even sms integration. As a way to save data, I imagine the video quality is slightly lower than what you'll get with a full Skype app, but this is the kind of compromise you should expect from a lite app. Skype Lite: Play Store (USA Included) | APK Mirror Other Apps to consider that these are some of the best Lite applications, but the search is not really necessary to end this. If you want to ease the load even more and some of your favorite apps don't have light versions, you can also install a fast and lightweight web browser, such as Puffin, and then use the web version of your favorite apps. Instagram is a great example here because the mobile web version is pretty good and even allows you to upload photos. Similarly, if you want to keep the data, you can continue to use Chrome and just activate data savings — you may sacrifice the quality of some of the pages you visit (again, Instagram is a good example here), but it's a price you have to pay to keep things light and lighter. Bite.
